THE

SUSPENSION SECTION

SUPER SHOX REAR SHOCK INSTALL

Coming from a Sprint and Midge car racing, the folks at Super Shox are in love with all things fast. They are also pretty into Harley-Davidson motorcycles as well. So it was inevitable that Super Shox was going to be making its own line of USA-made shock absorbers for V-twin motorcycles. These shocks are gas-assist monotube shocks like many others, but Super Shox are much different than many aftermarket suspension offerings. The Super Shox have a light-feeling compression movement to let the suspension move freely over

those little shutter bumps and freeway grooves, but they also have advanced valving to control those substantial impacts like potholes and speed bumps. Another nice accouterment these shocks possess is a calibrated preload adjuster, so one can really dial in their personal suspension quality for both solo and two-up riding.

We installed a set on our favorite commuter H-D Dyna and were very pleased with their great looks and amazing overall performance over anything the tarmac threw at us. **HB**
